74LVXC4245
8-Bit Dual Supply Configurable Voltage Interface Transceiver with TRI-STATE®Outputs

General Description

The LVXC4245 is a 24-pin dual-supply, 8-bit configurable voltage interface transceiver suited for PCMCIA and other real time configurable I/O applications. The V_{CCA} pin accepts a 5V supply level. The "A" port is a dedicated 5V port. The V_{CCB}pin accepts a 3V-to-5V supply level. The "B" port is configured to track the V_{CCB} supply level respectively. A 5V level on the V_{CC} pin will configure the I/O pins at a 5V level and a 3V V_{CC} will configure the I/O pins at a 3V level. This device will allow the V_{CCB} voltage source pin and I/O pins on the "B" port to float when $\overline{OE}$ is HIGH. This feature is necessary to buffer data to and from a PCMCIA socket that permits PCMCIA cards to be inserted and removed during normal operation.

Features

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: Worst case package.

Note 3: Max number of outputs defined as (n). Data inputs are driven 0V to V_{CC} level; one output at GND.

Note 4: Max number of Data Inputs (n) switching. (n−1) inputs switching 0V to V_{CC} level. Input-under-test switching: V_{CC} level to threshold (V_{IHD}), 0V to threshold (V_{ILD}), f = 1 MHz.

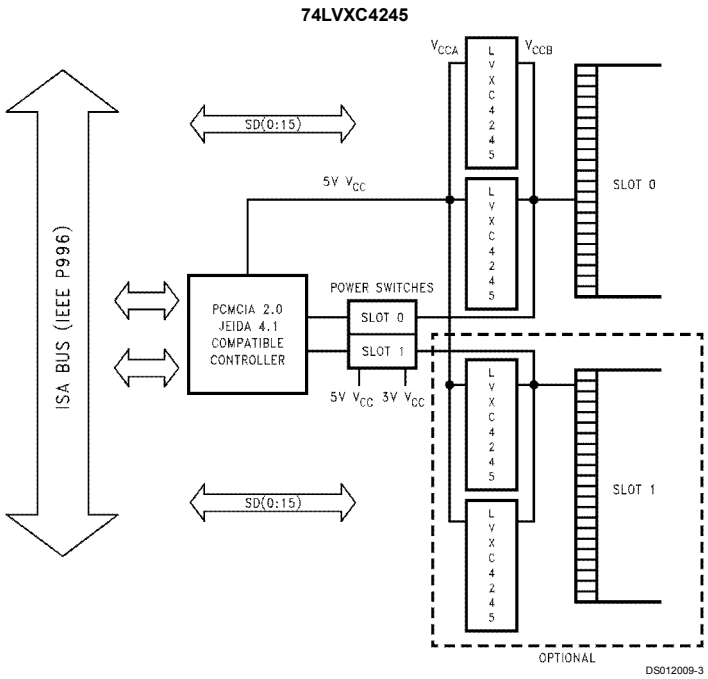
Configurable I/O Application for PCMCIA Cards

Block Diagram



The LVXC4245 is a 24-pin dual supply device well suited for PCMCIA configurable I/O applications. Ideal for low power notebook designs, the LVXC4245 consumes less than 1 mW of quiescent power in all modes of operation. The LVXC4245 meets all PCMCIA I/O voltage requirements at 5V and 3.3V operation. By tying V_{CCB} of the LVXC4245 to the card voltage supply, the PCMCIA card will always experience rail to rail output swings, maximizing the reliability of the interface.

The V_{CCA} pin on the LVXC4245 must always be tied to a 5V power supply. This voltage connection provides internal references needed to account for variations in V_{CCB}. When connected as in the block diagram above, the LVXC4245 meets all the voltage and current requirements of the ISA bus standard (IEEE P996).
