## Adjustment-Free, 8 & 10-Bit DACs

### FEATURES

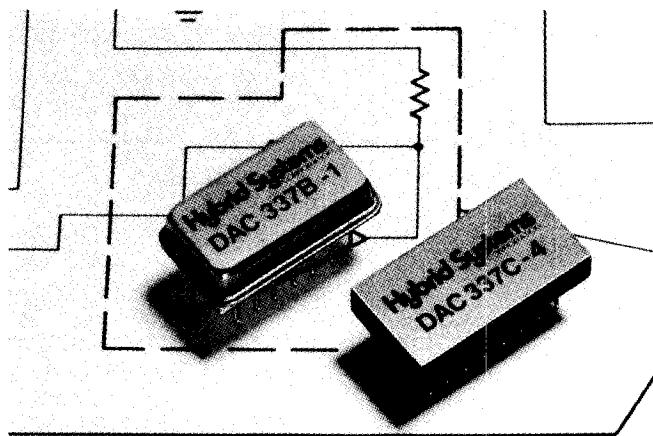

- 8 and 10 Bit Versions
- No Zero Or Gain Adjusts
- $\pm \frac{1}{2}$  LSB Linearity
- Internal Reference and Output Amplifier
- MIL-STD-883 or Comm./Indust. Processing
- Low Power

### DESCRIPTION

The DAC337 Series digital-to-analog converters are designed for completely adjustment-free operation.

The word "simplicity" best characterizes the DAC337 Series. All models are housed in hermetically-sealed DIP style packages and operate on  $\pm 15V$  power supplies. Each model incorporates a precision reference, highly stable thin-film nichrome resistor network, output amplifier, and switches.  $\pm \frac{1}{2}$  LSB linearity is achieved without the use of external zero and gain adjustment circuits.

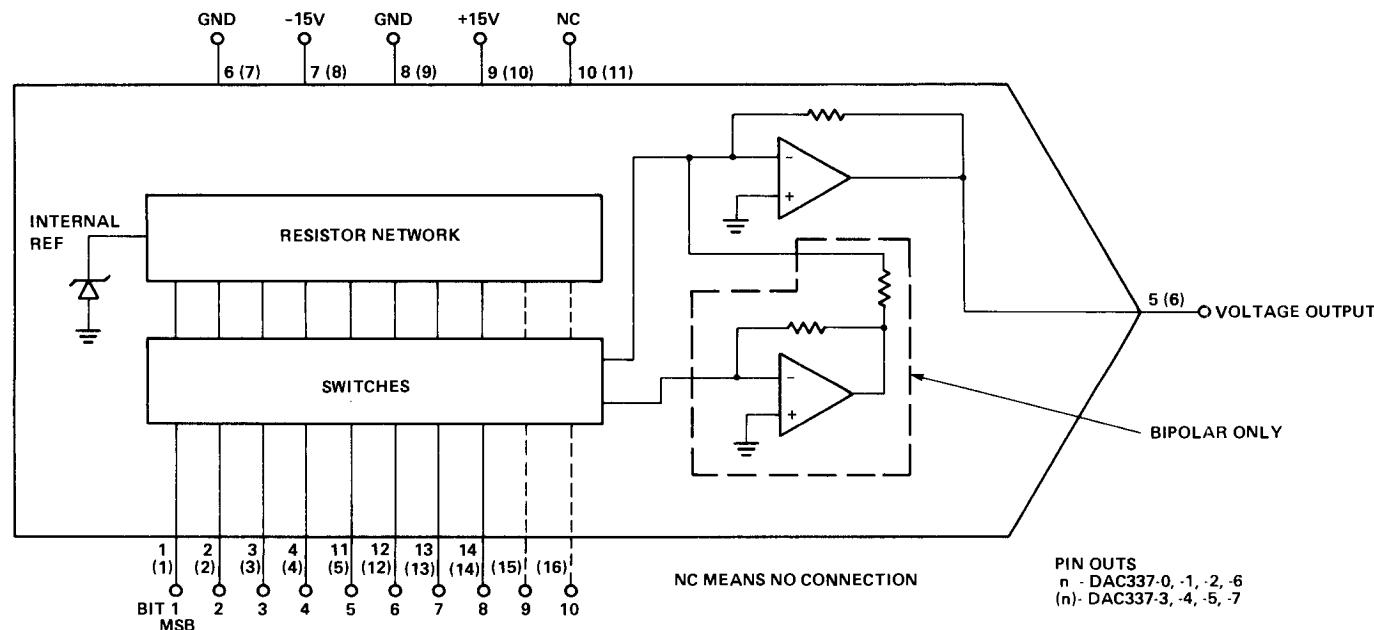

Both the 8- and 10-Bit versions are offered with the

choice of four output voltage ranges: 0 to +10, 0 to -10 (unipolar) and  $\pm 5$ ,  $\pm 10$  (bipolar).

Hybrid Systems offers two grades of processing: commercial/industrial (Option C) and MIL-STD-883 Rev. C, Level B (Option B).

**CAUTION:** ESD (Electro-Static Discharge) sensitive device. Permanent damage may occur when unconnected devices are subjected to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. Protective foam should be discharged to the destination socket before devices are removed. Devices should be handled at static safe workstations only. Unused digital inputs must be grounded or tied to the logic supply voltage. Unless otherwise noted, the supply voltage at any digital input should never exceed the supply voltage by more than 0.5 volts or go below -0.5 volts. If this condition cannot be maintained, limit input current on digital inputs by using series resistors or contact Hybrid Systems for technical assistance.
