

DM74ALS109A Dual J-K Positive-Edge-Triggered Flip-Flop with Preset and Clear

General Description

The DM74ALS109A is a dual edge-triggered flip-flop. Each flip-flop has individual J, \bar{K} , clock, clear and preset inputs, and also complementary Q and \bar{Q} outputs.

Information at input J or \bar{K} is transferred to the Q output on the positive going edge of the clock pulse. Clock triggering occurs at a voltage level of the clock pulse and is not directly related to the transition time of the positive going pulse. When the clock input is at either the high or low level, the J, \bar{K} input signal has no effect.

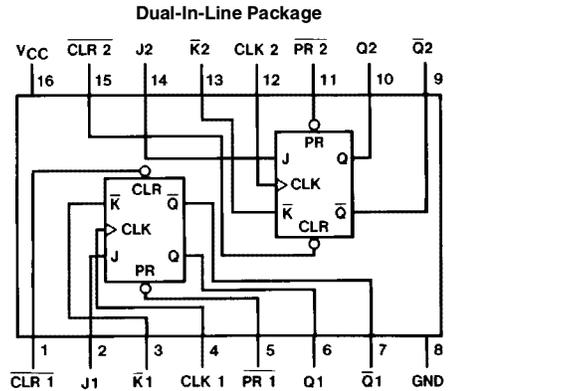

Asynchronous preset and clear inputs will set or clear Q output respectively upon the application of low level signal.

The J- \bar{K} design allows operation as a D flip-flop by tying the J and \bar{K} inputs together.
