

2K × 8 Very Low Power CMOS SRAM

Description

The HM 65162 is a very low power CMOS static RAM organized as 2048 × 8 bits. It is manufactured using the MHS high performance CMOS technology.

The HM 65162 is a "Pure CMOS SRAM" utilising an array of six transistor (6T) memory cells permitting the lowest possible standby supply current (typical value = 0.1 μA) over the full temperature range. The high stability of the 6T cell provides excellent protection against soft errors due to noise.

Easy memory expansion is provided by an active low chip select (\overline{CS}), an active low output enable (\overline{OE}) and three state drivers.

All inputs and outputs of the HM-65162 are TTL compatible and operate from single 5 V supply thus simplifying system design.

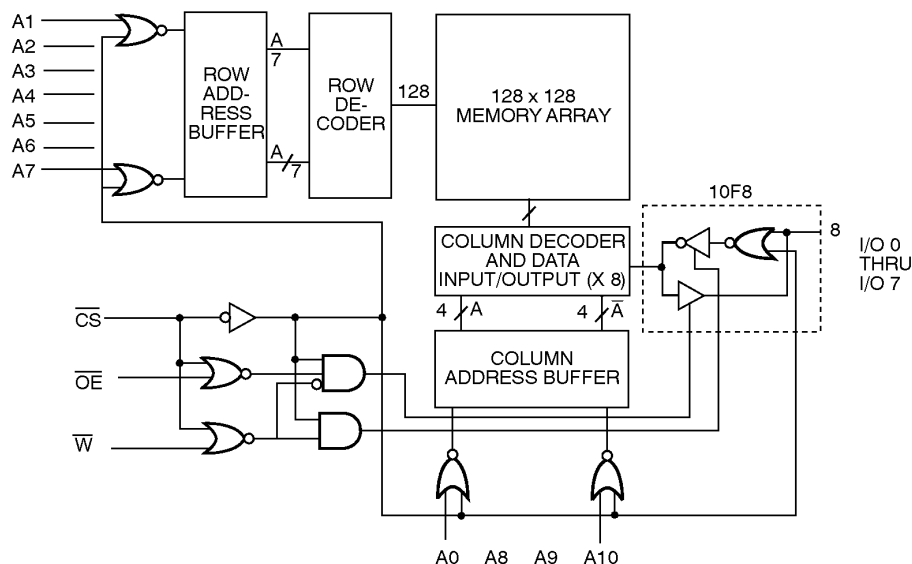

The HM 65162 is 100 % processed following the test methods of MIL STD 883C and/or ESA/SCC 9000, making it ideally suitable for military/space applications that demand superior levels of performance and reliability.

Features

- Access Time
 - Commercial : 70 ns (max)
 - Automotive/Military/Industrial : 70/85 ns (max)
- Very Low Power Consumption
 - Active : 240 mW (typ)
 - Standby : 2.0 μW (typ)
 - Data Retention : 0.8 μW (typ)
- Wide Temperature Range : -55 to +125°C
- 600 Mils Width Package
- TTL Compatible Inputs and Outputs
- Asynchronous
- Single 5 Volt Supply
- Equal Cycle and Access Time
- Gated Inputs : No Pull-up/Down Resistors Are Required

- Notes :
5. $\overline{CS} \geq V_{IH}$.
 6. $\overline{CS} \geq V_{cc} - 0.3 \text{ V}$, $I_{out} = 0 \text{ mA}$.
 7. $\overline{CS} \leq V_{IL}$, $I_{out} = 0 \text{ mA}$, $V_{in} = \text{Gnd}/V_{cc}$.
 8. $V_{cc} \text{ max}$, $I_{out} = 0 \text{ mA}$, $f = 1 \text{ MHz}$ and 5 mA/MHz , $V_{in} = \text{Gnd}/V_{cc}$.

Data Retention Mode

MHS CMOS RAM's are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules insure data retention :

1. Chip select (\overline{CS}) must be held high during data retention ; within V_{CC} to $V_{CC} - 0.2$ V.
2. Output Enable (\overline{OE}) should be held high to keep the RAM outputs high impedance, minimizing power dissipation.

3. \overline{CS} and \overline{OE} must be kept between $V_{CC} + 0.3$ V and 70 % of V_{CC} during the power up and power down transitions.
4. The RAM can begin operation > 55 ns after V_{CC} reaches the minimum operating voltage (4.5 V).

TWHDX	Data hold time	10	10	10	ns	min
TWHQX (12)	Write high to low Z	0	0	0	ns	min

Note : 12. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Write Cycle 1 (\overline{W} Controlled) (note 13)

Write Cycle 2 (\overline{CS} Controlled) (note 13)

Note : 13. The internal write time of the memory is defined by the overlap of \overline{CS} LOW and \overline{W} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
Data I/O Pins enter high-impedance state, as shown, when \overline{OE} is held LOW during write.

Read Cycle

Addresses must remain stable for the duration of the read cycle. To read \overline{OE} and \overline{CS} must be $< V_{IL}$ and $\overline{W} > V_{IH}$. The output buffers can be controlled independently by \overline{OE} while \overline{CS} is low. To execute consecutive read cycles, \overline{CS}

may be tied low continuously until all desired locations are accessed. When \overline{CS} is low, addresses must be driven by stable logic levels and must not be in the high impedance state.

Burn-in Schematics

$R1 = 1\text{ K}\Omega$
 $R2 = 2.2\text{ K}\Omega$
 $Fo = 25\text{ KHz} \pm 20\%$
 $Fn = 1/2 F n - 1$
 $S0, S1, S2$: programmable signals
 for write / read cycles
 $VCC = 5.5\text{ V}$
