

# LH5498

**CMOS 2K × 9 FIFO**

## FEATURES

- Fast Access Times: 15/20/25/35/50/65/80 ns
- Full CMOS Dual Port Memory Array
- Fully Asynchronous Read and Write
- Expandable in Width and Depth
- Full, Half-Full, and Empty Status Flags
- Read Retransmit Capability
- TTL Compatible I/O
- Packages:  
28-Pin, 300-mil DIP  
28-Pin, 600-mil DIP  
32-Pin PLCC
- Pin and Functionally Compatible with IDT7203

## FUNCTIONAL DESCRIPTION

The LH5498 is a dual port memory with internal addressing to implement a First-In, First-Out algorithm. Through an advanced dual port architecture, it provides fully asynchronous read/write operation. Empty, Full, and Half-Full status flags are provided to prevent data overflow and underflow. In addition, internal logic is provided for unlimited expansion in both word size and depth.

Read and Write operations automatically access sequential locations in memory in such a way that data is read out in the same order that it was written, that is on a First-In, First-Out basis. Since the address sequence is internally predefined, no external address information is required for the operation of this device. A ninth data bit is provided for parity or control information often needed in communication applications.

Empty, Full, and Half-Full status flags monitor the extent to which data has been written into the FIFO, and prevent improper operations (i.e. Read if the FIFO is empty, or Write if the FIFO is full). A retransmit feature resets the Read address pointer to its initial position, thereby allowing repetitive readout of the same data. Expansion In and Expansion Out pins implement an expansion scheme that allows individual FIFOs to be cascaded to greater depth without incurring additional latency (bubblethrough) delays.

## PIN CONNECTIONS

## PIN DESCRIPTIONS

PIN	PIN TYPE *	DESCRIPTION
D <sub>0</sub> - D <sub>8</sub>	I	Input Data Bus
Q <sub>0</sub> - Q <sub>8</sub>	O/Z	Output Data Bus
$\bar{W}$	I	Write Request
$\bar{R}$	I	Read Request
$\bar{EF}$	O	Empty Flag
$\bar{FF}$	O	Full Flag

PIN	PIN TYPE *	DESCRIPTION
$\bar{XO}/\bar{HF}$	O	Expansion Out/Half-Full Flag
$\bar{XI}$	I	Expansion In
$\bar{FL}/\bar{RT}$	I	First Load/Retransmit
$\bar{RS}$	I	Reset
V <sub>CC</sub>	V	Positive Power Supply
V <sub>SS</sub>	V	Ground

\* I = Input, O = Output, Z = High-Impedance, V = Power Voltage Level

**ABSOLUTE MAXIMUM RATINGS**<sup>1</sup>

PARAMETER	RATING
Supply Voltage to V <sub>SS</sub> Potential	-0.5 V to 7 V
Signal Pin Voltage to V <sub>SS</sub> Potential <sup>3</sup>	-0.5 V to V <sub>CC</sub> + 0.5 V (not to exceed 7 V)
DC Output Current <sup>2</sup>	± 50 mA
Storage Temperature Range	-65°C to 150°C
Power Dissipation (Package Limit)	1.0 W
DC Voltage Applied to Outputs In High-Z State	-0.5 V to V <sub>CC</sub> + 0.5 V (not to exceed 7 V)

**NOTES:**

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating for transient conditions only. Functional operation of the device at these or any conditions other than those indicated in the "Operating Range" of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Outputs should not be shorted for more than 30 seconds. No more than one output should be shorted at any time.
- Negative undershoots of 1.5 V in amplitude are permitted for up to 10 ns once per cycle.

**OPERATING RANGE**

SYMBOL	PARAMETER	MIN	MAX	UNIT
T <sub>A</sub>	Temperature, Ambient	0	70	°C
V <sub>CC</sub>	Supply Voltage	4.5	5.5	V
V <sub>SS</sub>	Supply Voltage	0	0	V
V <sub>IL</sub>	Logic "0" Input Voltage <sup>1</sup>	-0.5	0.8	V
V <sub>IH</sub>	Logic "1" Input Voltage	2.0	V <sub>CC</sub> + 0.5	V

**NOTE:**

- Negative undershoots of 1.5 V in amplitude are permitted for up to 10 ns once per cycle.

**DC ELECTRICAL CHARACTERISTICS (OVER OPERATING RANGE)**

SYMBOL	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
I <sub>LI</sub>	Input Leakage Current	V <sub>CC</sub> = 5.5 V, V <sub>IN</sub> = 0 V to V <sub>CC</sub>	-10	10	μA
I <sub>LO</sub>	Output Leakage Current	$\bar{R} \geq V_{IH}$ , 0 V ≤ V <sub>OUT</sub> ≤ V <sub>CC</sub>	-10	10	μA
V <sub>OH</sub>	Output High Voltage	I <sub>OH</sub> = -2.0 mA	2.4		V
V <sub>OL</sub>	Output Low Voltage	I <sub>OL</sub> = 8.0 mA		0.4	V
I <sub>CC</sub>	Average Supply Current <sup>1</sup>	Measured at f = 40 MHz		100	mA
I <sub>CC2</sub>	Average Standby Current <sup>1</sup>	All Inputs = V <sub>IH</sub>		15	mA
I <sub>CC3</sub>	Power Down Current <sup>1</sup>	All Inputs = V <sub>CC</sub> - 0.2V		5	mA

**NOTE:**

- I<sub>CC</sub>, I<sub>CC2</sub>, and I<sub>CC3</sub> are dependent upon actual output loading and cycle rates. Specified values are with outputs open.

## AC TEST CONDITIONS

PARAMETER	RATING
Input Pulse Levels	V <sub>SS</sub> to 3 V
Input Rise and Fall Times (10% to 90%)	5 ns
Input Timing Reference Levels	1.5 V
Output Reference Levels	1.5 V
Output Load, Timing Tests	Figure 4

## CAPACITANCE <sup>1,2</sup>

PARAMETER	RATING
C <sub>IN</sub> MAX (Input Capacitance)	5 pF
C <sub>O</sub> MAX (Output Capacitance)	7 pF

### NOTES:

1. Sample tested only.
2. Capacitances are maximum values at 25°C measured at 1.0MHz with V<sub>IN</sub> = 0 V.

## NOTES:

- All timing measurements performed at "AC Test Condition" levels.
- Pulse widths less than minimum value are not allowed.
- Values guaranteed by design not currently tested.
- Only applies to read data flow-through mode.

## OPERATIONAL DESCRIPTION

### Reset

The device is reset whenever the Reset pin ( $\overline{RS}$ ) is taken to a LOW state. The reset operation initializes both the read and write address pointers to the first memory location. The  $\overline{X1}$  and  $\overline{FL}$  pins are also sampled at this time to determine whether the device is in Single mode or Depth Expansion mode. A reset pulse is required when the device is first powered up. The Read ( $\overline{R}$ ) and Write ( $\overline{W}$ ) pins may be in any state when reset is initiated, but must be brought to a HIGH state  $t_{RRSS}$  and  $t_{WRSS}$  before the rising edge of  $\overline{RS}$ .

### Write

A write cycle is initiated on the falling edge of the Write ( $\overline{W}$ ) pin. Data setup and hold times must be observed on the data-in ( $D_0 - D_8$ ) pins. A write operation is only possible if the FIFO is not full, (i.e. the Full flag pin is HIGH). Writes may occur independently of any ongoing read operations.

At the falling edge of the first write after the memory is half filled, the Half-Full flag will be asserted ( $\overline{HF} = \text{LOW}$ ) and will remain asserted until the difference between the write pointer and read pointer indicates that the remaining data in the device is less than or equal to one-half the total capacity of the FIFO. The Half-Full flag is deasserted ( $\overline{HF} = \text{HIGH}$ ) by the appropriate rising edge of  $\overline{R}$ .

The Full flag is asserted ( $\overline{FF} = \text{LOW}$ ) at the falling edge of the write operation which fills the last available location in the FIFO memory array. The Full flag will inhibit further writes until cleared by a valid read. The Full flag is deasserted ( $\overline{FF} = \text{HIGH}$ ) after the next rising edge of  $\overline{R}$  releases another memory location.

### Read

A read cycle is initiated on the falling edge of the Read ( $\overline{R}$ ) pin. Read data becomes valid on the data out ( $Q_0 - Q_8$ ) pins after a time  $t_A$  from the falling edge of  $\overline{R}$ . After  $\overline{R}$  goes HIGH, the data out pins return to a high-impedance state. Reads may occur independent of any ongoing write operations. A read is only possible if the FIFO is not empty ( $\overline{EF} = \text{HIGH}$ ).

The internal read and write address pointers are maintained by the device such that consecutive read operations will access data in the same order as it was written. The Empty flag is asserted ( $\overline{EF} = \text{LOW}$ ) after the falling edge of  $\overline{R}$  which accesses the last available data in the FIFO memory.  $\overline{EF}$  is deasserted ( $\overline{EF} = \text{HIGH}$ ) after the next rising edge of  $\overline{W}$  loads another word of valid data.

### Data Flow-Through

Read flow-through mode occurs when the Read ( $\overline{R}$ ) pin is brought LOW while the FIFO is empty, and held LOW in anticipation of a write cycle. At the end of the next write cycle, the Empty flag will be momentarily deasserted, and the data just written will become available on the data out pins after a maximum time of  $t_{WEF} + t_A$ . Additional writes may occur while the  $\overline{R}$  pin remains LOW, but only data from the first write flows through to the outputs. Additional data, if any, can only be accessed by toggling  $\overline{R}$ .

Write flow-through mode occurs when the Write ( $\overline{W}$ ) pin is brought LOW while the FIFO is full, and held LOW in anticipation of a read cycle. At the end of the read cycle, the Full flag will be momentarily deasserted, but then immediately reasserted in response to  $\overline{W}$  held LOW. Data is written into the FIFO on the rising edge of  $\overline{W}$  which may occur  $t_{RFF} + t_{WPW}$  after the read.

### Retransmit

The FIFO can be made to reread previously read data through the retransmit function. Retransmit is initiated by pulsing  $\overline{RT}$  LOW. This resets the internal read address pointer to the first physical location in the memory while leaving the internal write address pointer unchanged. Data between the read and write pointers may be re-accessed by subsequent reads. Both  $\overline{R}$  and  $\overline{W}$  must be inactive (HIGH) during the retransmit pulse. Retransmit is useful if no more than 2048 writes are performed between resets. Retransmit may affect the status of  $\overline{EF}$ ,  $\overline{HF}$ , and  $\overline{FF}$  flags, depending on the relocation of the read pointer. This function is not available in depth expansion mode.

## OPERATIONAL MODES

### Single Device Configuration

When depth expansion is not required for the given application, the device is placed in Single mode by tying the Expansion In pin ( $\overline{XI}$ ) to ground. This pin is internally sampled during reset.

### Width Expansion

Word-width expansion is implemented by placing multiple LH5498 devices in parallel. Each LH5498 should be configured for standalone mode. In this arrangement, the behavior of the status flags is identical for all devices; so, in principle, a representative value for each of these flags could be derived from any one device. In practice, it is better to derive 'composite' flag values using external logic, since there may be minor speed variations between different actual devices. (See Figures 17 and 18.)

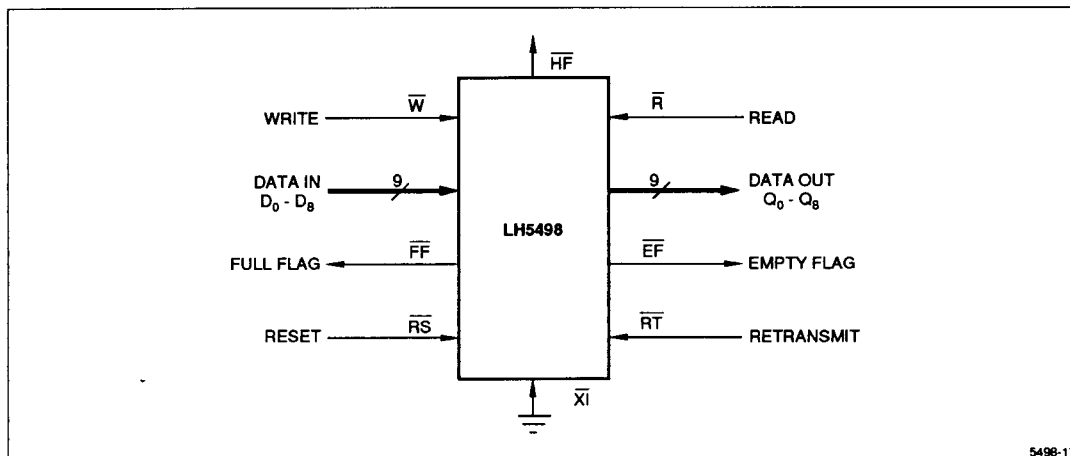

Figure 17. Single FIFO (2K × 9)

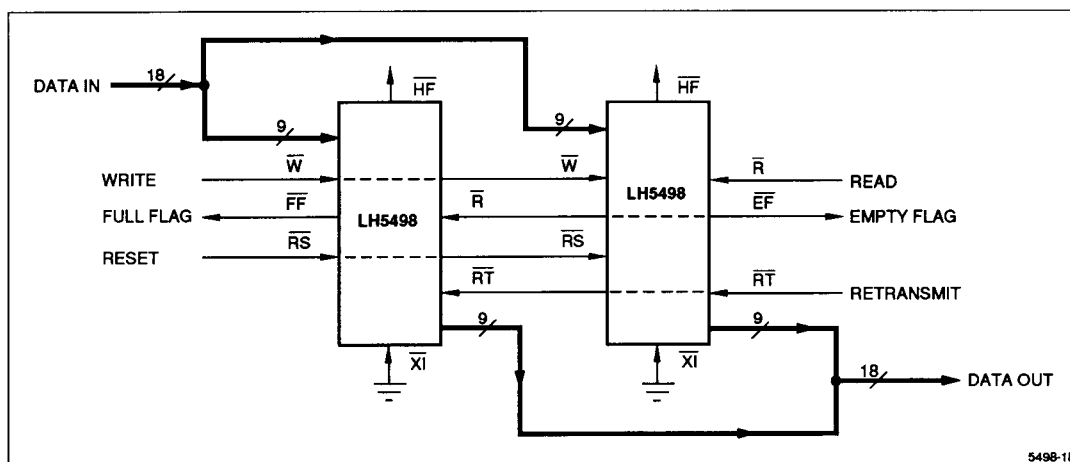

Figure 18. FIFO Width Expansion (2K × 18)

## OPERATIONAL MODES (cont'd)

### Compound Expansion

A combination of width and depth expansion can be easily implemented by operating groups of depth expanded FIFOs in parallel.

### Bidirectional Operation

Applications which require bidirectional data buffering between two systems can be realized by operating

LH5498 devices in parallel but opposite directions. The Data In pins of a device may be tied to the corresponding Data Out pins of another device operating in the opposite direction to form a single bidirectional bus interface. Care must be taken to assure that the appropriate read, write and flag signals are routed to each system. Both depth and width expansion may be used in this configuration.
