Dual Modulus Prescaler

These devices are two-modulus prescalers which will divide by 5 and 6, 8 and 9, respectively. A MECL-to-MTTL translator is provided to interface directly with the MC12014 Counter Control Logic. In addition, there is a buffered clock input and MECL bias voltage source.

- MC12009 480 MHz ($\div 5/6$), MC12011 550 MHz ($\div 8/9$)
- MECL to MTTL Translator on Chip
- MECL and MTTL Enable Inputs
- 5.0 or -5.2 V Operation*
- Buffered Clock Input — Series Input RC Typ, 20 Ω and 4.0 pF
- V_{BB} Reference Voltage
- 310 mW (Typ)

* When using a 5.0 V supply, apply 5.0 V to Pin 1 (V_{CCO}), Pin 6 (MTTL V_{CC}), Pin 16 (V_{CC}), and ground Pin 8 (V_{EE}). When using -5.2 V supply, ground Pin 1 (V_{CCO}), Pin 6 (MTTL V_{CC}), and Pin 16 (V_{CC}) and apply -5.2 V to Pin 8 (V_{EE}). If the translator is not required, Pin 6 may be left open to conserve dc power drain.

- NOTES:**
1. Test outputs of the device must be tested by sequencing through the truth table. All input, power supply and ground voltages must be maintained between tests. The clock input is the waveform shown.
 2. In addition to meeting the output levels specified, the device must divide by 5 or 8 during this test. The clock input is the waveform shown.
 3. In addition to meeting the output levels specified, the device must divide by 6 or 9 during this test. The clock input is the waveform shown.

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50 Ω resistor to -2.0 V. Test procedures are shown for only one gate. The other gates are tested in the same manner.

APPLICATIONS INFORMATION

The primary application of these devices is as a high-speed variable modulus prescaler in the divide by N section of a phase-locked loop synthesizer used as the local oscillator of two-way radios.

Proper VHF termination techniques should be followed when the clock is separated from the prescaler by any appreciable distance.

In their basic form, these devices will divide by 5/6 or 8/9. Division by 5, or 8 occurs when any one or all of the five gate inputs E1 through E5 are high. Division by 6, or 9 occurs when all inputs E1 through E5 are low. (Unconnected MTTL inputs are normally high, unconnected MECL inputs are normally low). With the addition of extra parts, many different division configurations may be obtained.
