

PECL* to TTL Translator (+5 Vdc Power Supply Only)

The MC10H350 is a member of Motorola's 10H family of high performance ECL logic. It consists of 4 translators with differential inputs and TTL outputs. The 3-state outputs can be disabled by applying a HIGH TTL logic level on the common OE input.

The MC10H350 is designed to be used primarily in systems incorporating both ECL and TTL logic operating off a common power supply. The separate V_{CC} power pins are not connected internally and thus isolate the noisy TTL V_{CC} runs from the relatively quiet ECL V_{CC} runs on the printed circuit board. The differential inputs allow the H350 to be used as an inverting or noninverting translator, or a differential line receiver. The H350 can also drive CMOS with the addition of a pullup resistor.

- (1) Common mode input voltage to pins 3-4, 5-6, 11-12, 13-14 must be between the values of 2.8 V and 5.0 V. This common mode input voltage range includes the differential input swing.
- (2) For single ended use, apply 3.75 V (V_{BB}) to either input depending on output polarity required. Signal level range to other input is 3.3 V to 4.2 V.
- (3) Any unused gates should have the inverting inputs tied to V_{CC} and the non-inverting inputs tied to ground to prevent output glitching.
- (4) 1.0 V to 2.0 V w/50 pF into 500 ohms.
