## GENERAL DESCRIPTION

The MT5C1008 is organized as a 131,072 x 8 SRAM using a four-transistor memory cell with a high-speed, low-power CMOS process. Micron SRAMs are fabricated using double-layer metal, double-layer polysilicon technology.

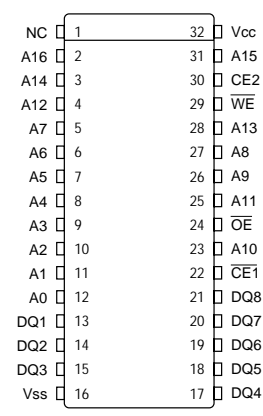

For flexibility in high-speed memory applications, Micron offers dual chip enables ( $\overline{CE1}$ , CE2) and an output enable ( $\overline{OE}$ ). This enhancement can place the outputs in High-Z for additional flexibility in system design.

## PIN ASSIGNMENT (Top View)

### 32-Pin DIP (SA-6)

### 32-Pin SOJ (SD-4, SD-5)

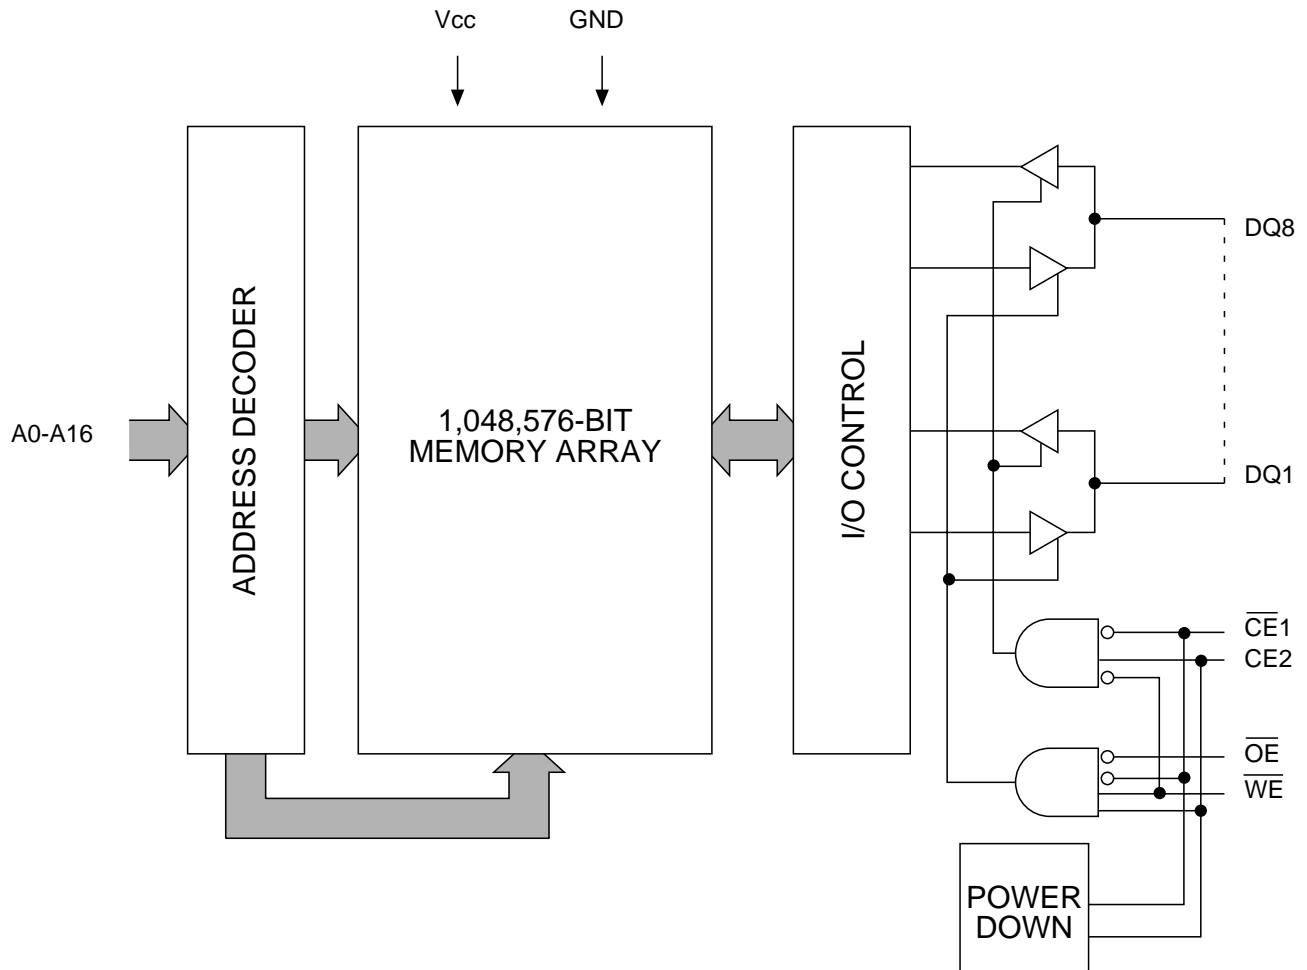

Writing to these devices is accomplished when write enable ( $\overline{WE}$ ) and  $\overline{CE1}$  inputs are both LOW and CE2 is HIGH. Reading is accomplished when  $\overline{WE}$  and CE2 remain HIGH and  $\overline{CE1}$  and  $\overline{OE}$  go LOW. The device offers reduced power standby modes when disabled. This allows system designers to meet low standby power requirements.

The "L" and "LP" versions each provide a 70% reduction in CMOS standby current ( $I_{SB2}$ ) over the standard version. The "LP" version also provides a 90% reduction in TTL standby current ( $I_{SB1}$ ). This is achieved by including gated inputs on the  $\overline{WE}$ ,  $\overline{OE}$  and address lines. The gated inputs also facilitate the design of battery backed systems where the designer needs to protect against inadvertent battery current drain during power-down, when inputs may be at undefined levels.

All devices operate from a single +5V power supply and all inputs and outputs are fully TTL-compatible.
