DESCRIPTION

The 'PCT273/A consists of eight edge triggered D-type flip-flops with individual D inputs and Q outputs. The common buffered clock (CP) and master reset ($\overline{MR}$) load and reset (clear) all flip-flops simultaneously. The 'PCT273/A is an edge triggered register. The state of each D input (one setup time before the low-to-high clock transition) is transferred to the corresponding flip-flop's Q output. All outputs will be forced low by a low voltage level on the $\overline{MR}$ input.

Notes:

1. Typical limits are at V_{CC} = 5.0V, T_A = +25°C ambient.
2. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
3. This parameter is guaranteed but not tested.
