MARCH 1984 — REVISED MAY 1986

- Fully Synchronous Operation for Counting and Programming
- Internal Look-Ahead for Fast Counting
- Carry Output for n-Bit Cascading
- Fully Independent Clock Circuit
- Package Options Include Plastic "Small Outline" Packages, Ceramic Chip Carriers, and Standard Plastic and Ceramic 300-mil DIPs
- Dependable Texas Instruments Quality and Reliability

description

These synchronous presettable counters feature an internal carry look-ahead for cascading in high-speed counting applications. The 'ALS168B and 'AS168 are decade counters and the 'ALS169B and 'AS169 are 4-bit binary counters. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when so instructed by the count-enable inputs and internal gating. This mode of operation helps eliminate the output counting spikes that are normally associated with asynchronous (ripple clock) counters. A buffered clock input triggers the four flip-flops on the rising (positive-going) edge of the clock waveform.

These counters are fully programmable; that is, the outputs may each be preset to either level. The load input circuitry allows loading with the carry-enable output of cascaded counters. As loading is synchronous, setting up a low level at the load input disables the counter and causes the outputs to agree with the data inputs after the next clock pulse.

The carry look-ahead circuitry provides for cascading counters for n-bit synchronous application without additional gating. Instrumental in accomplishing this function are two count-enable inputs and a carry output. Both count enable inputs ($\overline{\text{ENP}}$ and $\overline{\text{ENT}}$) must be low to count. The direction of the count is determined by the level of the U/D input. When U/D is high, the counter counts up; when low, it counts down. Input $\overline{\text{ENT}}$ is fed forward to enable the carry output. The ripple carry output (RCO) thus enabled will produce a low-level pulse while the count is zero (all inputs low) counting down or maximum (9 or 15) counting up. This low-level overflow carry pulse can be used to enable successive cascaded stages. Transitions at $\overline{\text{ENP}}$ or $\overline{\text{ENT}}$ are allowed regardless of the level of the clock input. All inputs are diode-clamped to minimize transmission-line effects, thereby simplifying system design.

These counters feature a fully independent clock circuit. Changes at control inputs ($\overline{\text{ENP}}$, $\overline{\text{ENT}}$, $\overline{\text{LOAD}}$, U/D) that will modify the operating mode have no effect on the contents of the counter until clocking occurs. The function of the counter (whether enabled, disabled, loading, or counting) will be dictated solely by the conditions meeting the stable setup and hold times.

The SN54ALS168B, SN54AS168, SN54ALS169B, and SN54AS169 are characterized for operation over the full military temperature range of -55°C to 125°C . The SN74ALS168B, SN74AS168, SN74ALS169B, and SN74AS169 are characterized for operation from 0°C to 70°C .
