

**CURRENT MODE SWITCHING
POWER SUPPLY CONTROL CIRCUIT**

- DIRECT DRIVE OF THE EXTERNAL SWITCHING TRANSISTOR
- POSITIVE AND NEGATIVE OUTPUT CURRENTS UP TO 0.5A
- CURRENT LIMITATION
- TRANSFORMER DEMAGNETIZATION AND POWER TRANSISTOR SATURATION SENSING
- FULL OVERLOAD AND SHORT-CIRCUIT PROTECTION
- PROPORTIONAL BASE CURRENT DRIVING
- LOW STANDBY CURRENT BEFORE STARTING (1.6mA)
- SYNCHRONIZATION CAPABILITY WITH INTERNAL PLL
- THERMAL PROTECTION

Due to its current mode regulation, the TEA2019 facilitates design of power supplies with following features :

- High stability regulation loop.
- Automatic input voltage feed-forward in discontinuous mode fly-back.
- Automatic pulse-by-pulse current limitation.

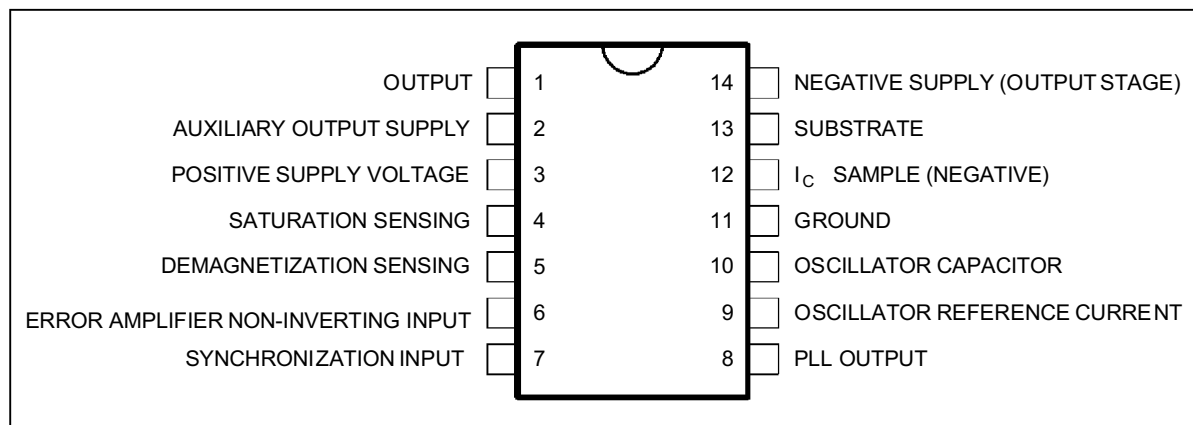

Typical applications : Video Display Units, TV sets, typewriters, micro-computers and industrial applications. For more details, see application note AN406/0591.

DESCRIPTION

The TEA2019 is an 14-pin DIP low cost integrated circuit designed for the control of switch mode power supplies. It has the same basic functions as the TEA2018A but with synchronization capability by internal PLL. It is particularly suitable for applications where oscillator synchronization is required.

TYPICAL CIRCUIT

2019-03:EPS

GENERAL DESCRIPTION

(see application note AN406/0591)

Operating Principles (Figure 1)

On every period, the beginning of the conduction time of the transistor is triggered by the fall of the oscillator saw-tooth which acts as clock signal. The period T_{osc} is given by :

$$T_{osc} \approx 0.69 C_t (R_t + 2000)$$

(T_{osc} in seconds, C_t in Farad, R_t in Ω)

The end of the conduction time is determined by a signal issued from comparing the following signals.

- the sawtooth waveform representing the collector current of the switching transistor, sampled across the emitter shunt resistor.
- the output of the error amplifier.

Base Drive

- Fast turn-on

On each period, a current pulse ensures fast transistor switch-on.

This pulse performs also the $t_{on(min)}$ function at the beginning of the conduction.

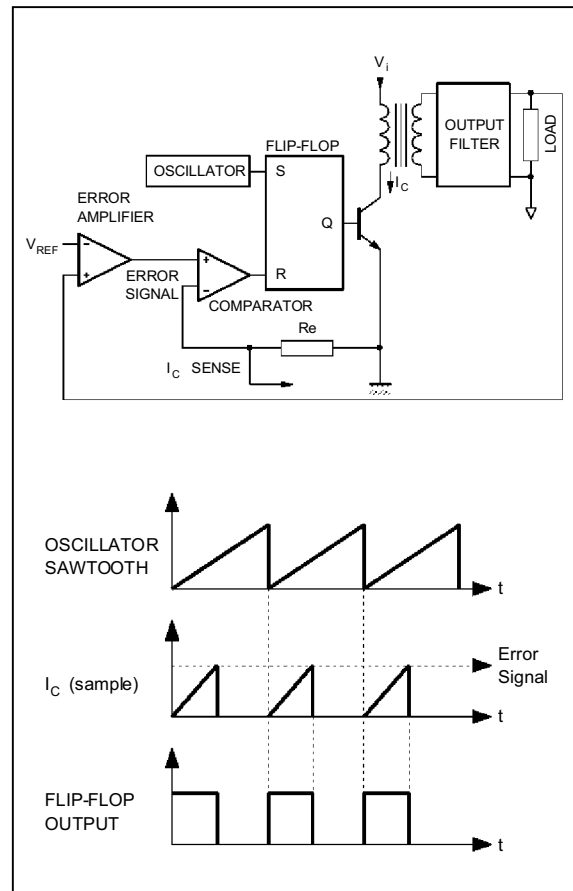

- Proportional base drive

In order to save power, the positive base current after the starting pulse becomes an image of the collector current.

The ratio $\frac{I_C}{I_B}$ is programmed as follows (Figure 2).

$$\frac{I_C}{I_B} = \frac{R_B}{R_E}$$

Figure 1 : Current Mode Control

2019-05:EPS / 2019-04:EPS

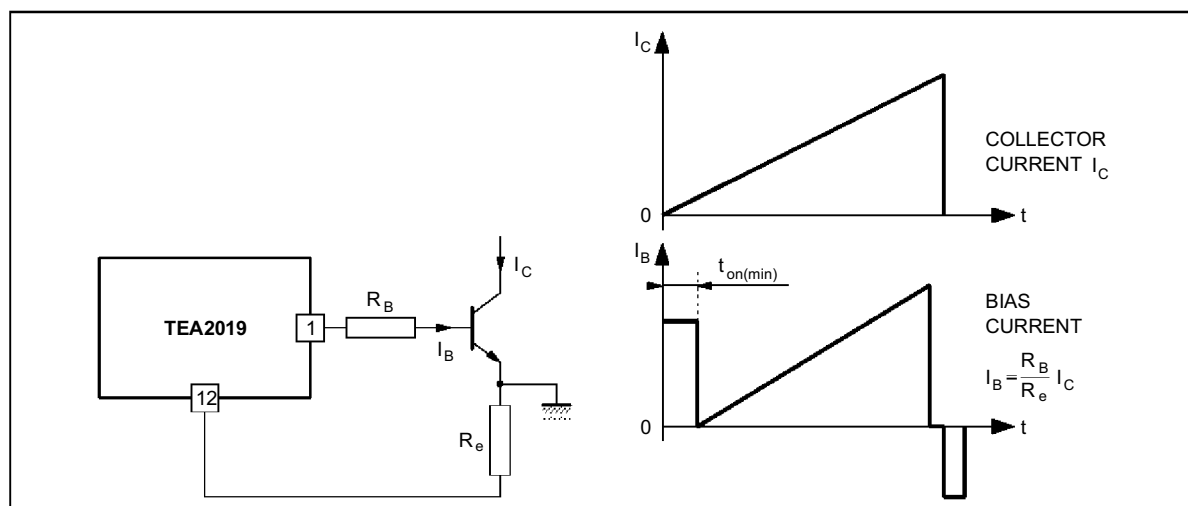

- **Efficient and fast switch-off**
When the positive base drive is removed, 1s (typically) will elapse before the application of negative current therefore allowing a safe and rapid collector current fall.

Safety Functions

- **Overload & short-circuit protection**
When the voltage applied to pin 12 exceeds the current limitation threshold voltage $[V_{th(I_C)}]$, the output flip-flop is reset and the transistor is turned off.
The shunt resistor R_e must be calculated so as to obtain the current limitation threshold on pin 12 at the maximum allowable collector current.

- **Demagnetization sensing**
This function disables any new conduction cycle of the transistor as long as the core is not completely demagnetized.
When not used, pin 5 must be grounded.
- $t_{on(max)}$
Outside the regulation area and in the absence of current limitation, the maximum conduction time is set at about 70% of the period.
- $t_{on(min)}$
A minimum conducting time is ensured during each period (see Figure 2).
- **Supply voltage monitoring**
The TEA2019 will stop operating if V_{CC+} on Pin 3 falls below the threshold level $V_{CC(stop)}$.

Figure 2

Starting Process (Figure 3)

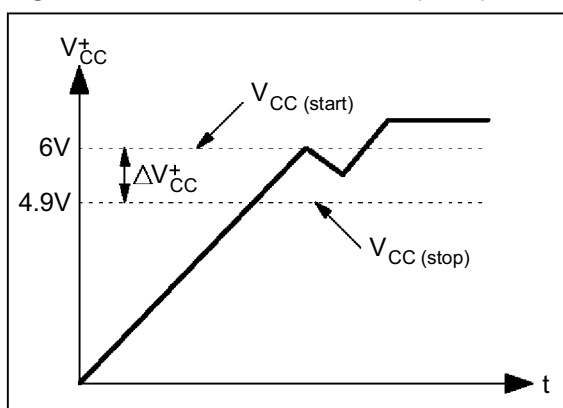

Prior to starting, a low current is drawn from the high voltage source through a high value resistor. This current charges the power supply storage capacitor of the device.

No output pulses are available before the voltage on pin 3 has reached the threshold level $[V_{CC(start)}, V_{CC}^+$ rising].

During this time the TEA2019 draws only 1mA (typically). When the voltage on pin 3 reaches this threshold base drive pulses appear.

The energy drawn by these pulses tends to discharge the power supply storage capacitor. However a hysteresis of about 1.1V (typically) (ΔV_{CC}) is implemented to avoid the device from stopping.

Figure 3 : Normal TEA2019 Start up Sequence

TEA2019

The TEA2019 has some additional capabilities compared to the TEA2018A:

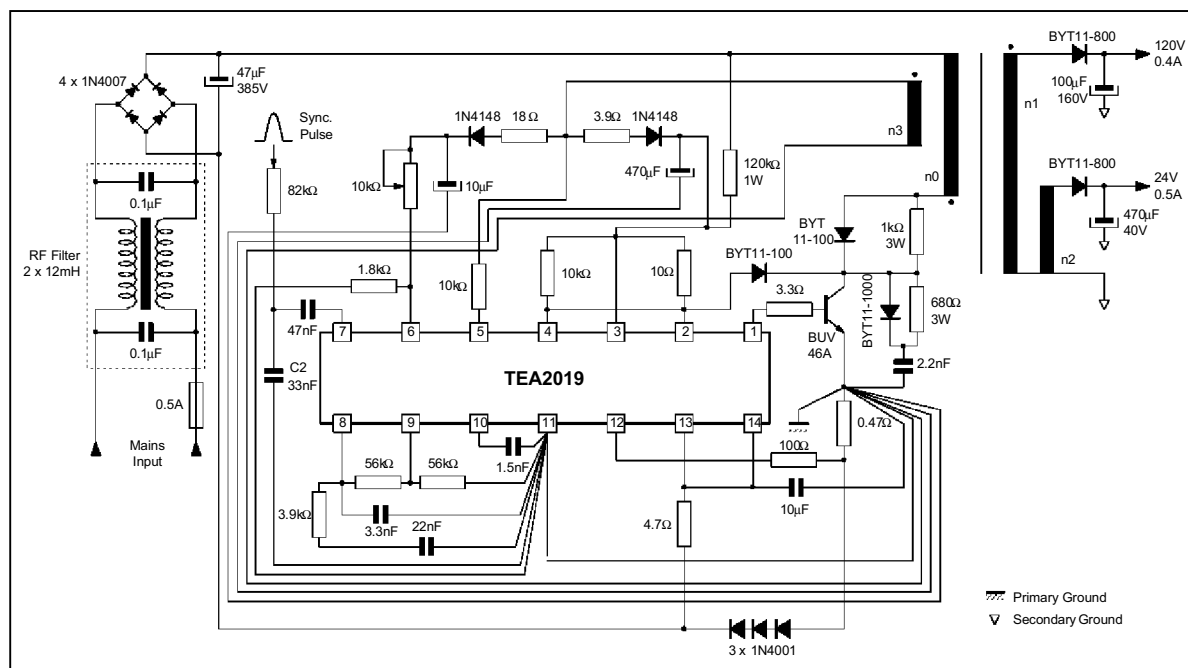

- The oscillator charge current is supplied through an internal current generator, programmed externally - instead of using an external charging resistor. The sawtooth so obtained is linear.
- The oscillator can be synchronized through an internal PLL circuit. This feature provides synchronization between the external sync pulse and the end of the switching transistor current. The sync pulse can be for example the fly-back pulse of a TV horizontal sweep circuit. As indicated in the application diagram, this pulse is applied first to a R.C. network to obtain a low voltage sawtooth and then to pin 7 of the circuit. The PLL output (pin 8) supplies a correction current to pin 9 through an external resistor, so as to maintain the oscillator at the correct frequency (refer to application note AN406/0591 for detailed information).
- In the TEA2019, the power supply of the positive output stage is separated from the main power supply, so that it can be supplied from a lower

voltage in order to reduce the I.C. power dissipation.

For low power applications, the circuit can be normally supplied by connecting pins 2 and 3 together.

- In order to protect the substrate (pin 13) from the parasitic voltage peaks produced by negative output current peaks at pin 14, the substrate (pin 13) is internally separated from the negative supply (pin 14). They must be externally connected together.
- The switching transistor saturation voltage can be monitored at pin 4. To achieve this, a high voltage diode must be connected between the collector of the switching transistor and pin 4. Also a resistor must be connected from pin 4 to V^+_{CC} (see application diagram). This arrangement is useful when the chosen value of base current is very low and as a consequence the saturation voltage will be high. In this event, when $V_{CE(sat)}$ increases above 2.5V, the base current is interrupted before the normal end of the period. Remark : the TEA2019 can also operate without this protection.

TYPICAL APPLICATION

- $P_{MAX} = 60W$
- Free-running Frequency : 15kHz
- $155V_{RMS} \leq V_{AC} \leq 250V_{RMS}$

- Outputs: 120V \pm 3%, 0.4A
24V \pm 3%, 0.5A
- V_{CE} Monitoring
