### DESCRIPTION

The TMM2063AP is a 65,536 bits high speed and low power static random access memory organized as 8,192 words by 8 bits and operates from a single 5V supply. Toshiba's high performance device technology provides both high speed and low power features with a maximum access time of 70ns/100ns/120ns and maximum operating current of 80mA. When CS1 is logical high or CS2 is a logical low, the device is placed in a low power standby mode in which maximum standby current is 10mA. Thus the TMM2063AP is most suitable for use in microcomputer peripheral memory where the low power applications are required, moreover, suitable for use in high density assembly as 0.3 inch width package is use for. The TMM2063AP is fabricated with ion implanted N channel silicon gate MOS technology for high performance and high reliability.
