### DESCRIPTION

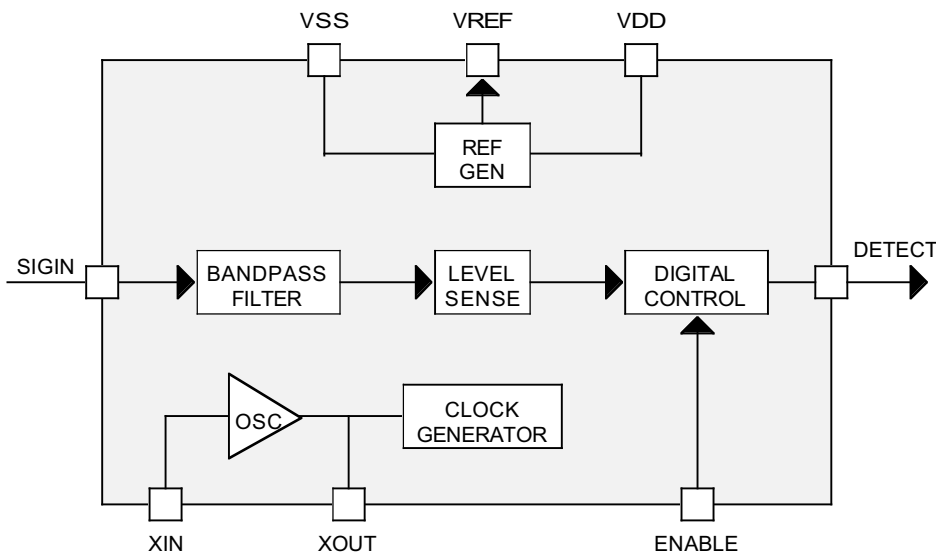

The TSC 75T980 Call Progress Tone Detector circuit allows automatic equipment to monitor tones in dial telephone systems that relate to the routing of calls. Such tones commonly include dial tones, circuits-busy tones, station-busy tones, audible ringing tones and others. By sensing signals in the range of 315 to 640 Hz, the TSC 75T980 does not require the use of precision tones to function. This means that tones which vary with location or call destination can be detected regardless of their exact frequency.

The low power CMOS switched capacitor filters used in the TSC 75T980 derive their accuracy from a 3.58 MHz clock, which in turn may be derived from other devices in the system being designed. The TSC 75T980 is available in a plastic 8-pin DIP and 16-pin SO packages.

### FEATURES

- Detects tones throughout the telephone progress supervision band (315 to 640 Hz)
- Sensitivity to -38 dBm
- Dynamic range over 36 dB
- 40 ms minimum detect (50 ms to output)
- Single supply CMOS (low power)
- Supply range 4.5 to 5.5 VDC
- Uses 3.58 MHz crystal or external clock
- 8-pin DIP and 16-pin SO packages
- Second source of Teltone M-980

### PIN DESCRIPTION

NAME	TYPE	DESCRIPTION
SIGIN	I	Accepts analog input signal. See "Electrical Characteristics" for voltage levels, and "Timing Characteristics" for timing.
DETECT	O	Call progress detect output. Goes to logic "1" when signal in 315-640 Hz band is sensed. See "Timing Characteristics."
ENABLE	I	Application of logic "1" on this pin enables the output; logic "0" disables output.
V <sub>REF</sub>	O	Supplies voltage at half V <sub>DD</sub> for voltage reference of on-chip op amps.
XIN, XOUT	I	Crystal connections to on-chip oscillator circuit.
V <sub>DD</sub>	-	Positive power supply connection
V <sub>SS</sub>	-	Negative power supply connection
