MULTIFUNCTION SYSTEM FOR TAPE PLAYERS

NOT FOR NEW DESIGN

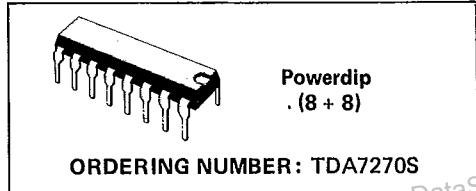

The TDA7270S is a multifunction monolithic integrated circuit in a 16-lead dual in-line plastic package specially designed for use in car radios cassette players, but suitable for all applications requiring tape playback.

It has the following functions:

- Motor speed regulator
- Automatic stop
- Manual stop
- Pause
- Cassette ejection
- Radio - Playback automatic switching.

The circuit incorporates also:

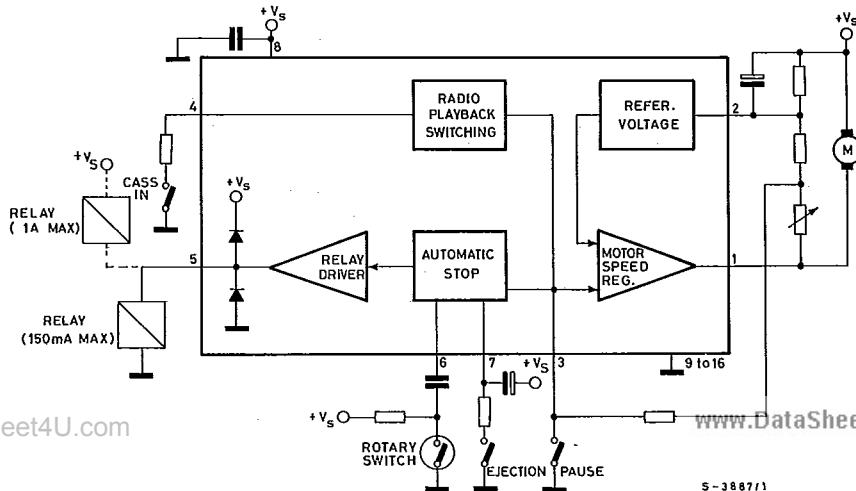

- Thermal protection
- Short circuit protection to ground (all the pins).

ORDERING NUMBER: TDA7270S

The TDA7270S incorporates four different functional blocks:

- 1) Motor speed control.
- 2) Autostop circuit.
- 3) Radio/Playback switching
- 4) Relay driver.

The motor speed control is a conventional circuit providing correction for the internal losses of the motor. Fig. 1 shows the external circuit.

The values of R_T , R_S and R_K determine the regulation characteristics and motor speed.

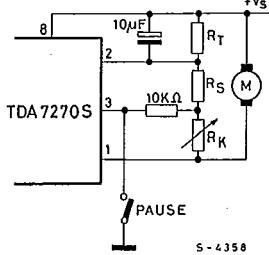

$$R_T = K \cdot R_M$$

where K = the IC regulator reflection coefficient and R_M = motor internal resistance.

The following condition must be always satisfied

$$R_S \leq 4 R_T$$

Fig. 1

The voltage applied across the motor is given by

$$V_{B-1} = V_{ref} \left[1 + \frac{R_T}{R_S} \left(1 + \frac{1}{K} \right) + \frac{R_K}{R_S} \right]$$

and this is proportional to R_K which therefore adjust the speed.

The voltage between pin 2 and the supply must not fall below 0.3V and so

$$\left[V_{ref \ min} \left(\frac{R_T}{R_S} \right) + I_M \ min \left(\frac{R_T}{K_{max}} \right) \right] > 0.3V$$

The "pause" condition corresponds to $V_3 < 50mV$; in this condition the motor will stop ($V_{1-2} < 0.2V$), the capacitor C_2 on the autostop circuit (see below) will no longer be charged and the pin 4 (cassette/radio switch output) will be pulled high.

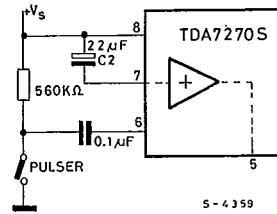

The autostop circuit

is shown in Fig. 2. In normal operation the capacitor C_2 (22μF) is slowly charged by a constant current drawn by pin 7 of 15μA, and each time the pulser (a switch on the cassette take-up speed shaft) closes, C_2 is discharged. If the cassette stops, and the pulse stops, the voltage on pin 7 falls.

This switches the power amplifier state and pin 5 goes low. Pin 5 can be used for one of two purposes:

- 1) to drive a stop warning light connected from pin 5 supply V_s ;
- 2) to actuate a solenoid wired either to ground (to release the cassette) or to supply (to eject the cassette).

The pause and/or cassette/radio switching shown in Fig. 3 has an input/output on pin 4. If pin 4 is not used it should be grounded.
