

PROGRAMMABLE V.23 MODEM WITH DTMF

- PROGRAMMABLE MODES :
 - Modem 75bps transmit, 1200bps receive
 - Modem 1200bps transmit, 75bps receive
 - DTMF dialing
 - Call status tone detection
 - Auxiliary analog transmit input
 - Analog test loopback
- PROGRAMMABLE FUNCTIONS :
 - Transmission level
 - Hysteresis and detection level
 - Filters (reception and transmission)
 - Line monitoring and buzzer
 - DTMF frequencies
- FIXED COMPROMISE LINE EQUALIZER
- AUTOMATIC BIAS ADJUSTMENT
- INTEGRATED DUPLEXER
- STANDARD LOW COST CRYSTAL (3.579MHz)
- TAX TONE REJECTION
- POWER-UP INITIALIZATION OF REGISTERS
- OPERATES FROM $\pm 5V$
- CMOS

DESCRIPTION

The TS7514 is an FSK modem which can be programmed for asynchronous half-duplex voice-band communications on a 2-wire line or full duplex

on a 4-wire line. Its programming concept makes it the ideal component to design low-cost intelligent modems, featuring auto dialing and auto answering. The TS7514 conforms to CCITT V.23 recommendation. The chip incorporates DTMF dialing, line monitoring, tone and dialing detection.

PIN DESCRIPTION

| Name | Pin Number | | Description |
|----------|------------|--------|---|
| | DIP24 | PLCC28 | |
| MOD/DMTF | 1 | 1 | MODEM or DMTF Operating Mode Selection. Also controls write operations to control registers (if MOD/DMTF = 0 and MC/BC = 0). |
| MC/BC | 2 | 3 | Digital Control Input. In MODEM mode, it sets transmission mode to main or back channel. It also permits selection of dialing or control registers programming. |
| RTS | 3 | 4 | Request to Send. When RTS = 0, the circuit sends an analog signal to the ATO output. The signal depends on the operating mode selected. When RTS = 1, the signal sent to ATO is suppressed after its first zero crossing. When MOD/DMTF = 0 and MC/BC = 0, the RTS pin acts as a clock for serial data loading into the input register. |
| ENP | 4 | 5 | Serial Register Write Select Input. When ENP = 0, the serial register input is connected to TxD. When ENP = 1, the register input is connected to PRD. |
| DGND | 5 | 6 | Digital Ground = 0V. All digital signals are referenced to this pin. |
| TxD | 6 | 7 | Digital Input for Transmit or Control Data |
| PRD | 7 | 8 | Digital Input for Control Data. Selected through ENP |
| XtalIN | 8 | 10 | Crystal Oscillator Input. Can be tied to an external clock generator. f _{QUARTZ} = 3.579MHZ. |
| XtalOUT | 9 | 11 | Crystal Oscillator Output |
| DCD | 10 | 13 | Data Carrier Detect Output |
| RxD | 11 | 14 | Digital Receive Data Output |

FUNCTIONAL DESCRIPTION

The TS7514 circuit is an FSK modem for half-duplex, voice-band asynchronous transmissions on a 2-wire line according to CCITT recommendation V.23 or full duplex on 4 wire-line.

The circuit features DTMF dialing, call status tone detection and line monitoring in both dialing and automatic answer modes. A signalling frequency is available at the line monitoring output (buzzer).

Ring detection is possible by using the signal detection function and bypassing the receive filter. The receive signal at ZCO output can be filtered in the associated microprocessor.

The TRANSMIT channel (Tx) includes :

- Two programmable frequency generators.
- One switched capacitor filter (SCF) with low-pass or bandpass configuration and its associated propagation delay corrector.
- One continuous time low-pass smoothing filter.
- One attenuator, programmable from 0 to + 13dB by 1dB steps.
- One programmable analog input.

The RECEIVE channel (Rx) includes :

- Two operational amplifiers for duplexer implementation.
- One continuous time low-pass anti-aliasing filter.
- One programmable gain amplifier.
- One linear compromise equalizer.
- One switched capacitor band pass filter (can be set to either main or back channel).
- One continuous time low pass smoothing filter.
- One limiting amplifier.
- One correlation demodulator.
- One programmable level signal detector.

The LINE MONITORING channel includes :

- One buzzer.
- One 3-channel multiplexer to select between :
 - Transmit channel monitoring.
 - Receive channel monitoring.
 - Buzzer.
- One programmable attenuator

Internal Control

Power-up Initialization

The TS7514 includes power-up initialization of control registers. This system sets the ATO transmission output to an infinite attenuation position, leaving time for the microprocessor to set up the RPROG input on power up. Control registers are also initialized when V+ is lower than 3V or V- greater than -3V.

Registers

Write access to the DTMF data register and to other control registers is achieved in serial mode through TxD input or PRD input. Addressing of these 4 bit registers is indirect. They are accessed through an 8 bit shift register addressed when MOD/DTMF = 0 and MC/BC = 0. Data sent to the TxD input is strobed on the RTS signal trailing edge.

Serial data is sent to the TxD input, with Least Significant Bit (LSB) first. The 4 Most Significant Bits (MSB) contain the control register address while the 4 LSB contain associated data.

Data transfer from the input register to the control register (addressed by the MSB's) is started by the operating mode (MODEM or DTMF) selection (MOD/DTMF = 1 or MC/BC = 1).

OPERATING MODES

The various operating modes are defined by MC/BC and MOD/DTMF inputs, and by the content of a control register RPROG.

The TS7514 includes 8 control registers. Access to each control register is achieved through an auxiliary 8-bit shift register (input register). The input of that shift register is connected either to TxD or PRD, depending upon the status of the ENP control pin (ie when ENP = 0 and ENP = 1 respectively). In both cases, the RTS input receives the shift clock and sequentially transfer is controlled by setting simultaneously MOD/DTMF and MC/BC to 0. The

previous internal status and data are memorized during loading of the input register so that transmission continues properly. That feature allows the user to modify transmission level or line monitoring selection during transmission. The transmit channel operating mode (Modem main or back channel, DTMF) can only be modified when RTS = 1. When RTS = 0, the ATO transmit output is enabled and the preselected operating mode is activated. When RTS returns to 1, Modem or DTMF transmission is inhibited after the first zero crossing of the generated signal.

| MOD/DTMF | MC/BC | Transmission (ATO) | Reception (RxD, DCD) |
|----------|-------|--|---|
| 1 | 1 | MODEM, Main Channel | MODEM, Back Channel |
| 1 | 0 | MODEM, Back Channel | MODEM, Main Channel |
| 0 | 1 | DTMF | DCD= Active Tone Detection (270 -500Hz) if RTS = 1... DCD = 1 if RTS = 0 |
| 0 | 0 | If RTS = 0 when that configuration occurs, transmission and reception are not modified. If RTS = 1 (no signal sent on the line), transmission is not modified and reception is set up to detect 2100Hz tone (note 1). | |

Note 1 : The decision threshold of the demodulator output is shifted, so that RxD changes from 0 to 1 at 1950Hz instead of 1700Hz.

CARRIER LEVEL DETECTOR

- Output Level Detection conditions
 The DCD signal detector output is set to logic state 0 if the RMS value of the demodulator input signal is greater than N1. The DCD output has logic state 1 if the RMS value is less than N2.

The detector has an hysteresis effect : N1 - N2.

- Timing Detection Requirements
 Signal detection time constants at the DCD output comply with CCITT Recommendation V.23.

| Modulation Ratio | DCD Transition | CCITT V.23 (min) | Min. | Max. | CCITT V.23 (max) | Unit |
|------------------|----------------|------------------|------|------|------------------|------|
| 1200bps | t1 | 10 | 10 | 20 | 20 | ms |

Transmission Spectrum

At the ATO output, the out-of-band signal power conforms to the following specifications :

Receiver

Measurement conditions
Local transmit level : -10dBm on lower channel at 75bps.

Receive level : -25dBm, with 511 bit pseudo-random test pattern.

Test equipment : TRT sematest.

Isochronous distortion

The following table shows typical isochronous distortion obtained with the TS7514 circuit :

| Line | Reception (1200) | Reception (75) |
|---------------|------------------|----------------|
| Line 1 (fiat) | 10 % | 4 % |
| Line 2 | 12 % | 4 % |

POWER SUPPLIES DECOUPLING AND LAYOUT CONSIDERATIONS

Power supplies to digital systems may contain high amplitude spikes and other noise. To optimize performances of the TS7514 operating in close proximity to digital systems, supply and ground noise should be minimized.

This involves attention to power supply design and circuit board layout.

The power supplies should be bypassed with tantalum or electrolytic capacitors to obtain noise free operation. These capacitors should be located close to the TS7514. The electrolytic type capacitors for improved high frequency performance.

Power supplies connections should be short and direct. Ground loops should be avoided.
