
Features

- Temperature and Supply Voltage Compensated Flashing Frequency
- Frequency Doubling Indicates Lamp Outage
- Relay Driver Output with High Current Carrying Capacity and Low Saturation Voltage
- Minimum Lamp Load for Flasher Operation: ≥ 1 W
- Very Low Susceptibility to EMI
- Protection According to ISO/TR 7637/1 Level 4

Description

The bipolar integrated circuit U6043B is used in relay-controlled automotive flashers where a high level EMC is required.

Lamp outage is indicated by frequency doubling during hazard warning as well as direction mode.

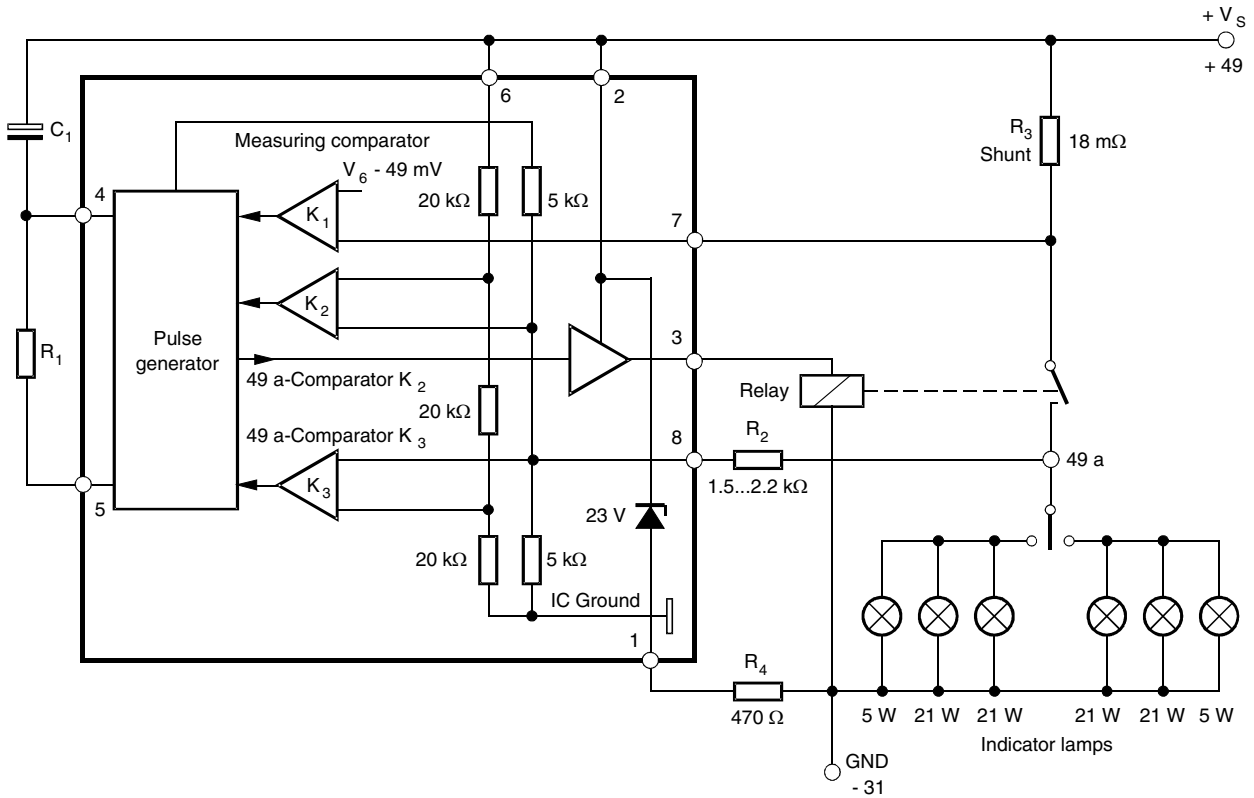

**Flasher IC with
18-m Ω Shunt**

Block Diagram

Figure 1. Car Flasher Application Circuit

Pin Configuration

Figure 2. Pinning

Pin Description

Pin	Symbol	Function
1	GND	IC ground
2	VS	Supply voltage
3	REL	Relay driver
4	OSC	Oscillator
5	OSC	Oscillator
6	VS	Supply voltage, Sense
7	LD	Lamp outage detection
8	SI	Start input (49a)

Functional Description

Pin 1, GND

The U6043B is protected against damage in case of battery reversal via resistor R_4 to ground (-31). An integrated protection circuit together with external resistances R_2 and R_4 limits the current pulses in the IC.

Pin 2, Supply Voltage, V_S power

The arrangement of the supply connections to Pin 2 (and 6) must be so as to ensure that on the connection printed circuit board (PCB), the resistance of V_S to Pin 6 is lower than that to Pin 2.

Pin 3, Relay Control Output (Driver)

The relay control output is a high-side driver with a low saturation voltage. It is capable of driving a typical automotive relay with a minimum coil resistance of 60 Ω .

Pin 4 and 5, Oscillator

The flashing frequency, f_1 , is determined by the R_1C_1 components as given by the following formula below (see Figure 1):

$$f_1 \approx \frac{1}{R_1 \times C_1 \times 1.5} \text{ Hz}$$

where $C_1 \leq 47 \mu\text{F}$, $R_1 = 6.8 \text{ k}\Omega$ to 510 $\text{k}\Omega$

In case of a lamp outage (see Pin 7) the oscillator frequency is switched to the lamp outage frequency f_2 with $f_2 \approx 2.2 \times f_1$.

Duty cycle in normal flashing mode: 50%

Duty cycle in lamp outage mode: 40% (bright phase)

Pin 6, Supply Voltage, Sense

For accurate monitoring via the shunt resistor, a minimized layer resistance from point V_S /shunt to Pin 6 is recommended.

Pin 7, Lamp Outage Detection

The lamp current is monitored via an external shunt resistor R_{sh} and an internal comparator K1 with its reference voltage of typ. 49 mV ($V_S = 12 \text{ V}$). The outage of one lamp is detected according to the following calculation:

Nominal current of 1 lamp: $21 \text{ W}/(V_S = 12 \text{ V})$: $I_{lamp} = 1.75 \text{ A}$

Nominal current of 2 lamps: $2 \times 21 \text{ W}/(V_S = 12 \text{ V})$: $I_{lamp} = 3.5 \text{ A}$

We recommend setting the detection threshold in the middle of the current range:

$$I_{outage} \approx 2.7 \text{ A}$$

Thus, the shunt resistor is calculated as:

$$R_{sh} = V_T (K1)/I_{outage}$$

$$R_{sh} = 49 \text{ mV}/2.7 \text{ A} = 18 \text{ m}\Omega$$

Comparator K1's reference voltage is matched to the characteristics of filament lamps (see "Control Signal Threshold" in the data part).

The combination of shunt resistor and resistance of wire harness prevents Pin 7 from a too high voltage in case of shorted lamps.

Pin 8, Start Input

Start condition for flashing: the voltage at Pin 8 has to be below the K3 threshold (flasher switch closed).

Humidity and dirt may decrease the resistance between 49 a and GND. If this leakage resistance is $> 5 \text{ k}\Omega$, the IC is still kept in the off-condition. In this case the voltage at Pin 8 is between the thresholds of comparators K2 and K3.

During the bright phase the voltage at Pin 8 is above the K2 threshold, during the dark phase it is below the K3 threshold. For proper start conditions a minimum lamp wattage of 1 W is required.

Absolute Maximum Ratings

Reference point Pin 1

Parameters		Symbol	Value	Unit
Supply voltage	Pin 2 and 6	V_S	16.5	V
Surge Forward Current				
$t_p = 0.1 \text{ ms}$	Pin 2 and 6	I_{FSM}	1.5	A
$t_p = 300 \text{ ms}$	Pin 2 and 6	I_{FSM}	1.0	A
$t_p = 300 \text{ ms}$	Pin 8	I_{FSM}	50	mA
Output current	Pin 3	I_O	0.3	A
Power Dissipation				
$T_{amb} = 95^\circ\text{C}$	DIP 8	P_{tot}	420	mW
	SO8	P_{tot}	340	mW
$T_{amb} = 60^\circ\text{C}$	DIP 8	P_{tot}	690	mW
	SO8	P_{tot}	560	mW
Junction temperature		T_J	150	$^\circ\text{C}$
Ambient temperature range		T_{amb}	-40 to +95	$^\circ\text{C}$
Storage temperature range		T_{stg}	-55 to +150	$^\circ\text{C}$

Thermal Resistance

Parameters		Symbol	Value	Unit
Junction ambient	DIP8	R_{thJA}	110	K/W
	SO8	R_{thJA}	160	K/W

Electrical Characteristics

Typical values under normal operation in application circuit (see Figure 1), V_S (+49, Pin 2 and 6) = 12 V.
Reference point ground (-31), $T_{amb} = 25^\circ\text{C}$, unless otherwise specified.

Parameters	Test Conditions	Symbol	Min.	Typ.	Max.	Unit
Supply voltage range	Pin 2 and 6	V_S	9		15	V
Supply current	Dark phase, Pin 2 and 6	I_S		4.5	8	mA
	Bright phase, Pin 2 and 6	I_S		7.0	11	mA
Relay control output:	Pin 3 $I_O = 150\text{ mA}$, $V_S = 9\text{ V}$	V_O			1.0	V
Saturation voltage						
Reverse current		I_O			0.1	mA
Start delay (Delay time)	First bright phase	t_{on}			10	ms
Frequency tolerance	Normal flashing	Δf_1	-5		+5	%
Bright period	Basic frequency f_1	Δf_1	47		53	%
	Control frequency f_2	Δf_2	37		45	%
Frequency increase	Lamp outage	f_2	$2.15 \times f_1$		$2.3 \times f_1$	Hz
Control signal threshold	$V_S = 15\text{ V}$, Pin 7	V_{RS}	50	53	57	mV
	$V_S = 9\text{ V}$, Pin 7	V_{RS}	43	45	47	mV
	$V_S = 12\text{ V}$, Pin 7	V_{RS}	47	49	51	mV
Leakage resistance	49a to GND	R_P		4	5	k Ω
Lamp load		P_L	1			W
