KEYBOARD CONTROLLER

GENERAL DESCRIPTION

The W83C42 keyboard controller is programmed to support the IBM® compatible personal computer keyboard serial interface. The keyboard controller receives serial data from the keyboard, checks the parity of the data, translates the scan code, and presents the data to the system as a byte of data in its output buffer. The controller will interrupt the system when data is placed in its output buffer. The byte of data will be sent to the keyboard serially with an odd parity bit automatically inserted. The keyboard is required to acknowledge all data transmissions. No transmission should be sent to the keyboard until acknowledge is received for the previous byte sent.

Winbond Electronics Corporation has developed a fast keyboard controller and BIOS to improve the performance of IBM PC/AT® 386™DX/SX and 486™DX/SX machines and their compatibles. Hardwire methodology is used in this keyboard controller instead of software implementation, as in the traditional 8042 keyboard BIOS. This enables the keyboard controller to respond instantly to all commands sent from the keyboard to the CPU BIOS.

The keyboard controller enables popular programs such as AutoCAD®, Microsoft® Windows™ 3.1, NOVELL®, and other programs to run much faster.

FEATURES

- Supports IBM PC/AT 386DX/SX and 486 DX/SX system designs
- Runs much faster than traditional keyboard controllers
- Host interface compatible with traditional keyboard controller
- 6MHz~12MHz operating frequency
- Communicates with keyboard directly
- High-reliability CMOS technology
- Available packages: 40-pin DIP, 44-pin PLCC

STATUS REGISTER

The status register is an 8-bit read-only register at I/O address hex 64 that holds information about the state of the keyboard controller and interface. It may be read at any time.

BIT	BIT DESCRIPTION	FUNCTION
0	Output Buffer Full	0: Output Buffer Empty 1: Output Buffer Full
1	Input Buffer Full	0: Input Buffer Empty 1: Input Buffer Full
2	System Flag	This bit may be set to 0 or 1 by writing to the system flag bit in the command byte of the keyboard controller. It is set to 0 after a power-on reset
3	Command/data	0: Data Byte 1: Command Byte
4	Inhibit Switch	0: Keyboard is Inhibited 1: Keyboard is Not Inhibited
5	Transmit Time Out	0: No Transmit Time Out Error 1: Transmit Time Out Error

BIT	BIT DESCRIPTION	FUNCTION
6	Receive Time Out	0: No Receive Time Out Error 1: Receive Time Out Error
7	Parity Error	0: Odd Parity (No Error) 1: Even Parity (Error)

OUTPUT BUFFER

The output buffer is an 8-bit read-only register at I/O address hex 60. The keyboard controller uses the output buffer to send the scan code received from the keyboard and data bytes required by command to the system. The output buffer should be read only when the output buffer full bit in the register is 1.

INPUT BUFFER

The input buffer is an 8-bit write-only register at I/O address hex 60 or 64. Writing to address hex 60 sets a flag that indicates a data write; writing to address hex 64 sets a flag that indicates a command write. Data written to I/O address hex 60 are sent to the keyboard (unless the keyboard controller is expecting a data byte) following the controller's input buffer only if the input buffer full bit in the status register is set to 0.

I/O PORTS

The keyboard controller has two 8-bit I/O ports and two test inputs. One of the ports is assigned for input and the other for output. The controller uses the test inputs to read the state of the keyboard's clock line and data line.

The following figures show bit definitions for the input, output, and test-input ports.
